

Live Demo: Multi-Currency Exchange Rates Online

Dear friends of GCU,

At our conference in Copenhagen this June one of the participating monetary authorities requested that we showed the [Trade-Weighted Equilibrium Exchange Rate System by GCU](#) in real-time. So, now we have made available online the first live rates (updated every 3 seconds).

This online demo visualizes how supply-and-demand in the currency markets relevant for each given country is directly factored in through use of the GCU mechanism, the Index-Key. Also, the demo serves to document the viability and functioning of this new type of exchange rates, designed to be **market-determined while at the same time more stable**.

The innovation on display here is how the combined information from currency markets and trade-flows is actually made operational so that at any given moment balance is achieved, based on current supply and demand. For many countries, this can contribute to a better-performing exchange rate paradigm.

The functioning of the system can be illustrated by three particular aspects:

- 1) Its ability to identify the point of balance, what we call the “center of exchange-rate gravity,” for a given country;
- 2) Its functioning as a fulcrum under that point of balance; and
- 3) Its support for transaction-settlement as a market-maker, if no direct market is otherwise available between banks.

A more stable while still market-determined exchange rate paradigm is plainly doable. It is here, and you can see for yourself: [LINK](#).

Best regards,
